

Designer Cut Series- CineWhite™

Matte White Projection Material

Care & Use

Proper care and use of the **CineWhite™** will maximize the life of the material to bring you years of enjoyment.

Projection Side

The CineWhite™ material has a matte white finish on the front and is black on the back. This black backing prevents light penetration from behind.

Material Maintenance

Wrinkles/Creases:

The material may have minor wrinkles which will get removed after stretching it tightly over a frame or a mounting system that allows tensioning.

Dust/Dirt:

A feather duster should be used to remove loose dirt or dust. Use mild soap and warm water on a microfiber cloth to clean dirt or dust spots. Do not rub or scrape the material.

Quick Tip

For best picture quality results, maintain a minimum viewing distance if possible 1.5 times the width of your projection image. The CineWhite™ material best performs in environments where lighting can be completely controlled.
